

AMENDMENTS TO THE SPECIFICATION

Please replace Paragraph 80 as published with the following paragraph rewritten in amendment format:

[0080] Typically, the outer shell may be formed from a hollow semi tubular substantially cylindrical pipe, of which part of the outer wall has been removed along the whole length of the pipe, such that the outer shell forms a channel having first and second exposed edges_peripheral-surfaces 405, 406 extending between the first and second ends and running along a whole of the length of the outer shell, and which oppose each other across a gap. Typically, the wall may extend over an angle in the range 260.degree. to 280.degree., about a longitudinal centre line of said outer shell, with a gap in the wall extending over the remaining 100.degree. to 80.degree. of a complete circle. First and second longitudinally extending surfaces 405, 406 in the embodiments shown are substantially parallel to each other, but in other embodiments, the surfaces may extend substantially radially from a center point of the tubular member center line of the substantially tubular outer shell.
